Lightweight Concrete

MORE
than just
roofing

Roof Systems Lightweight Concrete allows architects and building contractors greater versatility in design and performance of a flat concrete roof or deck. It provides a very effective and efficient method of insulating the concrete base from intense heat, and for creating drainage slopes which facilitate quick surface water runoff as well as eliminate any chances of ponding or stagnation.

Our lightweight concrete is custom blended as per the weight and thickness required for each particular job. With onsite mixing, as well as laying by our professional team, we have the technical "know how" in finishing a concrete roof or deck effectively. The end result is a proper roof surface that will not leak or accumulate water, or absorb high levels of heat; which is exactly what's required for the harsh tropical weather common to the Caribbean region.
